

Use Case Presentation Guide

Structure: Bring Your Own Greenfield Project

Before the Session

Each person should select a **greenfield project** from their own line of work. Choose something real enough that a plan, build, and test cycle makes sense, such as:

- A script
- A small tool
- A workflow
- A report generator
- Another project that fits the person's role

Keep the concept broad, but arrive with **two to three concrete components** already identified. Do not plan the entire project in advance.

During Day 3

Each person will work through the governed workflow and select **two to three components** to build during the session. Each component should map to a Skill or subagent use:

- **Component A:** Something that reuses or creates a Skill, such as a formatting convention, domain checklist, or repeatable transformation.
- **Component B:** Something delegated to a subagent, such as a research or lookup task, test-writing task, or review task. Verify the result through diff review before merging.
- **Component C (optional):** A second subagent or Skill combination, or the safety-control component, such as a hook or guardrail configured for the project.

Run the same governed loop practiced on Days 1 and 2 for each component:

1. Enter **plan mode**.
2. Reach a **checkpoint**.
3. Perform a **diff review**.
4. Run **tests as a gate**.

This process creates the evidence trail, including Git log entries and audit log entries if configured, that each person will cite in their capstone report.

Track Evidence as You Go

Record the following during the session, rather than reconstructing the numbers from memory afterward. Every number should be backed by evidence:

- **Skills used or created**, with a one-line benefit for each
- **Subagents invoked**, including the verification step that confirmed each result was satisfactory
- **Token usage per line of code produced**, surfaced by the tool or estimated from API or CLI usage logs

- **The hook or guardrail configured**, including why it was selected

After Training Ends

Each person's project continues with their own LoB team. The Day 3 session is the **seed and proof of concept**, not the finished product.

The two to three components built during the session become the reference pattern. This includes:

- Packaged Skills
- Defined subagent roles
- A configured guardrail

The team can extend this pattern afterward.

Quick Preparation Checklist

Each person should confirm that they have:

- ☐ Chosen a greenfield project scoped to two to three buildable components
- ☐ Started a token-usage-per-LoC table to complete live, rather than estimating after the fact
- ☐ Identified one hook or guardrail to describe generically, without project-specific business content
- ☐ The individual ready to field questions and answers

Schedule

Time	Block
8:30 am to 12:30 pm ET	Build capstone (4 hours)
12:30 pm to 1:30 pm	Lunch
1:30 pm to 2:25 pm ET	Build capstone: final polish and evidence preparation
2:25 pm to 2:30 pm	Kickoff: confirm presenter list, format, and running order
2:30 pm to approximately 3:50 pm	Presentations for approximately nine participants
3:50 pm to 4:00 pm	Wrap-up and close

Continue on Capstone and complete evidence preparation

The final 55-minute build block, should be used to complete pending capstone work and then capture the token-usage-per-LOC table.

This preparation separates a presenter who can support their numbers live from one who is searching for them during the presentation.

Presentation Format

The presentation window is **80 minutes, from 2:30 pm to 3:50 pm**.

Format	Content	Questions and answers	Approximate total per person	Capacity in 80 minutes
Full slot	5 minutes	Approximately 3 minutes	Approximately 8 minutes	Approximately 9 people
